## 1 Thursday, 9/12/2024, Representation of $\mathfrak{sl}_2(\mathbb{F})$ by Hechi

$$\mathfrak{sl}_2(\mathbb{F}) := \{g \in \mathfrak{gl}_2(\mathbb{F}) \mid \text{Tr}(g) = 0\}$$

We assume  $\text{char}(\mathbb{F}) = 0$  and  $\mathbb{F}$  is algebraically closed.

**Theorem 1.1.**  $\mathfrak{sl}_2(\mathbb{F})$  is semisimple

*Proof.* Direct computation of the Killing Form. □

Recall: if  $\mathfrak{L}$  is semisimple and  $\phi : \mathfrak{L} \rightarrow \mathfrak{gl}(V)$  is a representation.

$\mathfrak{L} \ni x = s + n$  abstract jordan decomposition.

$\implies \phi(x) = \phi(s) + \phi(n)$  is the Jordan decomposition of  $\phi(x)$  in  $\phi(\mathfrak{L})$ .

From now on,  $\mathfrak{L} = \mathfrak{sl}_2(\mathbb{F}) = \mathfrak{sl}(2, \mathbb{F})$ .

$(V, \phi)$  is a representation.

Basis of  $\mathfrak{L}$ :

$$x = \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix}$$

$$y = \begin{bmatrix} 0 & 0 \\ 1 & 0 \end{bmatrix}$$

$$h = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$$

Thus we have  $[h, x] = 2x, [h, y] = -2y, [x, y] = h$ .

Since  $h$  is diagonal,  $h$  is semisimple.

$\implies \phi(h)$  is semisimple and thus diagonalizable.  $\in \text{End}(V)$ .

We can decompose  $V = \bigoplus_{\lambda} V_{\lambda}$  where  $V_{\lambda} = \{v \in V \mid hv = \lambda v\}$  for all  $\lambda \in \mathbb{F}$ .

We say  $V_{\lambda}$  is a weight space with  $\lambda$  as its weight.

**Lemma 1.2** (7.1). Suppose  $v \in V_{\lambda}$ . Then,

1)  $xv \in V_{\lambda+2}$

2)  $yv \in V_{\lambda-2}$

*Proof.* 1)  $h(xv) = [h, x]v + x(hv) = 2xv + \lambda xv = (\lambda + 2)xv$

2)  $h(yv) = [h, y]v + y(hv) = -2yv + \lambda yv = (\lambda - 2)yv$

□

Note that  $\dim V < \infty$

Thus,  $\exists v \in V$  such that  $x \cdot v = 0$ .

Such a  $v$  is called a maximal vector.

For now, assume  $V$  is irreducible.

Let  $v_0$  be a maximal vector with weight  $\lambda$ .

**Definition.** For  $i > 0$  integer,  $v_i = \frac{y^i \cdot v_0}{i!}$

Also,  $v_{-1} = 0$ .

**Lemma 1.3** (7.2). 1)  $h \cdot v_i = (\lambda - 2i)v_i$

2)  $y \cdot v_i = (i + 1)v_{i+1}$

3)  $x \cdot v_i = (\lambda - i + 1)v_{i-1}$

*Proof.* 1) We use induction. Base case is clear.

Assume it is true for  $i - 1$ .

$v_{i-1} \in V_{\lambda-2(i-1)}$

Thus,  $v_i = \frac{1}{i} \cdot yv_{i-1}$

Lemma 7.1 implies  $v_i \in V_{\lambda-2i}$ .

2)  $y \cdot v_i = (i + 1)v_{i+1}$  by definition of  $v_i$ .

3)  $ix \cdot v_i = x(yv_{i-1}) = [x, y]v_{i-1} + yxv_{i-1} = hv_{i-1} + yxv_{i-1} = (\lambda - 2(i - 1))v_{i-1} + (\lambda - i + 2)yv_{i-2} = i(\lambda - i + 1)v_{i-1}$

□

$\dim V < \infty$  so it must end at some point.

So, at some point, it'll become 0.  $v_0, \dots, v_m \neq 0, v_{m+1} = 0$ .

**Definition.**  $m$  is the integer so that  $v_m \neq 0, v_{m+1} = 0$ .

By Lemma 7.2,

$\text{span}\{v_0, \dots, v_m\}$  is a sub-representation of  $V$ .

Since  $V$  is irreducible,

$V = \text{span}\{v_0, \dots, v_m\}$

Note: by 7.2(3),

$0 = x \cdot v_{m+1} = (\lambda - m)v_m$

Since  $v_m \neq 0$  we have  $\lambda = m$ .

Thus,  $\dim V = m + 1 = \lambda + 1$

Here  $m$  is the highest weight.

$$V = V_{-m} \oplus V_{-m+2} \oplus \dots \oplus V_{m-2} \oplus V_m$$

**Construction.** Suppose  $L \hookrightarrow \mathbb{F}[X, Y]$  [as a  $\mathbb{F}$ -space].

$$\rho(x) = X \frac{\partial}{\partial Y}$$

$$\rho(y) = Y \frac{\partial}{\partial X}$$

$$\rho(h) = x \frac{\partial}{\partial x} - y \frac{\partial}{\partial y}$$

Consider subrepresentations  $\mathbb{F}[X, Y]_m$  [symmetric polynomials of degree  $m$ , dimension  $m + 1$ ].

## 2 Thursday, 9/19/2024, Representation of $\mathfrak{sl}_2(\mathbb{F})$ by Hechi

### Root Space Decomposition

Let  $\mathcal{L}$  be a non-zero semisimple lie algebra over  $\mathbb{F}$  with  $\text{char } \mathbb{F} = 0$  and  $\mathbb{F}$  algebraically closed.

**Definition** (Toral Subalgebra). A subalgebra  $\mathcal{H} \subseteq \mathcal{L}$  toral if it consists of semisimple elements.

**Remark.** If every element in  $\mathcal{L}$  is ad-nilpotent, then by Engel's Theorem  $\mathcal{L}$  is nilpotent. Thus it is not semisimple.

So, there exists a non-zero toral subalgebra.

Fix  $\mathcal{H}$  to be the maximal toral subalgebra. A maximal subalgebra exists since  $\mathcal{L}$  is finite dimensional.

**Lemma 2.1** (8.1). A toral subalgebra  $\mathcal{T}$  is abelian.

*Proof.* Suppose  $x \in \mathcal{T}$ . We will prove that  $\text{ad}_{\mathcal{T}} x = 0$  [as a map].

$\text{ad}_{\mathcal{T}} x$  is diagonalizable. Assume some eigenvalue is non-zero. Then, we can find eigenvector  $y \in \mathcal{L}$  with eigenvalue  $a \neq 0$ . So,  $[x, y] = ay$ .

Now,  $\text{ad}_{\mathcal{T}} y(x) = [y, x] = -ay$ . Since  $[y, y] = 0$  we see that  $-ay$  is an eigenvector of  $\text{ad}_{\mathcal{T}} y$  with eigenvalue 0.

$\text{ad}_{\mathcal{T}} y$  is also diagonalizable. Suppose  $v_1, \dots, v_n$  is the eigenbasis of  $\text{ad}_{\mathcal{T}} y$  with eigenvalues  $\lambda_1, \dots, \lambda_n$ . Then  $x = a_1 v_1 + \dots + a_n v_n$  for  $a_i \in \mathbb{F}$ .

WLOG,  $v_1 = y$ .

$$[y, x] = a_1 \lambda_1 v_1 + \dots + a_n \lambda_n v_n = -ay$$

By comparing coefficients,  $a_1 \lambda_1 = -a$ . But  $\lambda_1 = 0$ . This is a contradiction.  $\square$

Now, we fix  $\mathcal{H}$  to be a maximal toral subalgebra. It is not necessarily unique.

Note that  $\text{ad } H$  is a commuting family in  $\text{End}(\mathcal{L})$ . From linear algebra we know that  $\text{ad } H$  is simultaneously diagonalizable.

**Definition** (Root Space Decomposition). Suppose  $\mathcal{H}^*$  is the dual space of  $\mathcal{H}$ . We can write:

$$\begin{aligned} \mathcal{L} &= \bigoplus_{\alpha \in \mathcal{H}^*} \{x \in \mathcal{L} \mid [h, x] = \alpha(h)x \forall h \in H\} \\ &= \mathcal{L}_0 \oplus \bigoplus_{\alpha \in \Phi} \mathcal{L}_\alpha \end{aligned}$$

where  $\Phi = \{\alpha \in \mathcal{H}^* \setminus \{0\} \mid \mathcal{L}_\alpha \neq 0\}$  and  $\mathcal{L}_0 = C_{\mathcal{L}}(\mathcal{H})$  [the centralizer].

This is called the root space decomposition.

**Example.**  $\mathfrak{sl}_2(\mathbb{F})$  has basis:

$$x = \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix}, y = \begin{bmatrix} 0 & 0 \\ 1 & 0 \end{bmatrix}, h = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$$

Then the root space decomposition is:

$$\mathfrak{sl}_2(\mathbb{F}) = \mathcal{H} \oplus \mathcal{L}_{-2} \oplus \mathcal{L}_2$$

$\mathcal{L}_{-2}$  contains the linear form sending  $h$  to  $-2$ .

**Proposition 2.2** (8.1). Let  $\alpha, \beta \in \mathcal{H}^*$ . Then,

$$1) [L_\alpha, L_\beta] \subseteq L_{\alpha+\beta} \text{ [by Jacobi Identity]}$$

2)  $\alpha \neq 0 \implies \forall x \in L_\alpha$  is nilpotent [by 1]

3)  $\alpha + \beta \neq 0 \implies L_\alpha \perp L_\beta$  w.r.t. the Killing Form.

*Proof of 3.* Find  $h \in \mathcal{H}$  such that  $(\alpha + \beta)(h) \neq 0$ . Then,

$$\kappa([h, x], y) = -\kappa([x, h], y) = -\kappa(x, [h, y])$$

$$\implies (\alpha + \beta)(h)\kappa(x, y) = 0$$

□

In particular,  $L_0 \perp L_\alpha$  when  $\alpha \in \Phi$ .

**Corollary 2.3** (8.1). The Killing Form restricted to  $\mathcal{L}_0$ ,  $\kappa|_{\mathcal{L}_0}$  is non-degenerate.

**Proposition 2.4** (8.2).  $\mathcal{H} = \mathcal{L}_0 = C_{\mathcal{L}}(\mathcal{H})$ .

*Proof.* Tedious linear algebra

□

**Corollary 2.5** (8.2). The Killing Form restricted to  $\mathcal{H}$ ,  $\kappa|_{\mathcal{H}}$  is non-degenerate.

This implies, the map  $H \rightarrow H^*$  given by  $x \mapsto \kappa(x, -)$  is an isomorphism.

For each  $\phi \in \mathcal{H}^*$  we can define  $t_\phi \in \mathcal{H}$  to be the pre-image of this isomorphism. So it satisfies

$$\phi(h) = \kappa(t_\phi, h) \quad \forall h \in \mathcal{H}$$

**Proposition 2.6** (8.3). 1)  $\Phi$  spans  $\mathcal{H}^*$

2) If  $\alpha \in \Phi$  then  $-\alpha \in \Phi$

3)  $x \in \mathcal{L}_\alpha, y \in \mathcal{L}_{-\alpha} \implies [x, y] = \kappa(x, y)t_\alpha$

4)  $\alpha(t_\alpha) = \kappa(t_\alpha, t_\alpha) \neq 0$

5)  $\dim[\mathcal{L}_\alpha, \mathcal{L}_{-\alpha}] = 1$ , spanned by  $t_\alpha$

6) Pick any non-zero  $x_\alpha \in L_\alpha \setminus \{0\}$ . Then there exists  $y_\alpha \in \mathcal{L}_{-\alpha}$  such that  $x_\alpha, y_\alpha, h_\alpha := [x_\alpha, y_\alpha]$  spans a subalgebra isomorphic to  $\mathfrak{sl}_2(\mathbb{F})$ , with the isomorphism  $x_\alpha \mapsto x, y_\alpha \mapsto y, h_\alpha \mapsto h$

7)  $h_\alpha = \frac{2t_\alpha}{\kappa(t_\alpha, t_\alpha)}$ .

If  $V$  is a  $\mathfrak{sl}_2(\mathbb{F})$ -module, recalling that  $h = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$ ,

$$V = \bigoplus_{\lambda \in \mathbb{F}} V_\lambda \text{ eigenspaces of } h$$

Recall that all  $\mathfrak{sl}_2(\mathbb{F})$ -module is of the form:

$$\mathfrak{sl}_2(\mathbb{F}) \curvearrowright \mathbb{F}[X, Y]$$

$$\rho(x) = X \frac{d}{dY}, \rho(y) = Y \frac{d}{dX}, \rho(h) = X \frac{d}{dX} - Y \frac{d}{dY}$$

and  $V = \mathbb{F}[X, Y]_m$  [homogeneous polynomials of degree  $m$ ] is irreducible and give us all irreducible representations.

Then we have:

$$V = V_{-m} \oplus V_{-m+2} \oplus \cdots \oplus V_{m-2} \oplus V_m$$

Where  $V_m$  is generated by  $X^m$  and  $V_{-m}$  is generated by  $Y^m$

If  $m$  even,  $0 \neq V_0 \subseteq V$

If  $m$  odd,  $0 \neq V_1 \subseteq V$

**Corollary 2.7.**  $V$  is a  $\mathfrak{sl}_2(\mathbb{F})$ -module. Then  $\dim V_0 + \dim V$  gives the number of summands in the irreducible decomposition of  $V$ .

Consider  $\mathcal{S}_\alpha = \text{span}\{x_\alpha, y_\alpha, h_\alpha\} \cong \mathfrak{sl}_2(\mathbb{F})$  and its adjoint representation ( $\mathcal{L}$  is an  $\mathcal{S}_\alpha$  module).

Fix  $\alpha \in \Phi$  and let  $\mathcal{M} = \mathcal{H} + \sum_{c \in \mathbb{F}^\times} \mathcal{L}_{c\alpha}$ .

By proposition 8.1,  $\mathcal{M}$  is a submodule of  $\mathcal{L}$  [since  $[\mathcal{L}_{c_1\alpha}, \mathcal{L}_{c_2\alpha}] \subseteq \mathcal{L}_{(c_1+c_2)\alpha}$ ].

If  $0 \neq x \in \mathcal{L}_{c\alpha}$  we see that  $[h_\alpha, x] = c\alpha(h_\alpha) \cdot x = 2cx$

$\implies 2c \in \mathbb{Z}$  and a weight of  $h_\alpha$  is 0 or an integer multiple of  $\frac{1}{2}$ .

Then  $\mathcal{M} = \underbrace{\ker \alpha}_{\substack{\text{eigenvalue} \\ \text{vectors of weight 0}}} + \underbrace{\mathbb{F} \cdot h_\alpha}_{\text{weight } 0, \pm 2}$

Therefore,  $\mathcal{M}$  contains vectors of weight only 0 or  $\pm 2$ .

Therefore, if  $\alpha \in \Phi$  we have  $c = \pm 1$ .

$\mathcal{M} = \mathcal{H} + \mathcal{S}_\alpha$ . Suppose  $h_\alpha^c$  is the complement of  $h_\alpha$  in  $\mathcal{H}$ .

Then,  $\mathcal{H} + \mathcal{S}_\alpha = \underbrace{h_\alpha^c}_{\text{abelian}} + \underbrace{\mathcal{S}_\alpha}_{\text{irreducible}}$  has  $\dim \mathcal{H} - 1 + 1 = \dim \mathcal{H} = \dim \mathcal{M} - 2$  irreducible

summands.

On the other hand, the number of irreducible summands of  $\mathcal{M}$  is  $\underbrace{\dim \mathcal{M}_0}_{\dim \mathcal{M} - 2} + \underbrace{\dim \mathcal{M}_1}_0$

Therefore,  $\mathcal{H} + \mathcal{S}_\alpha \subseteq \mathcal{M}$  must be equal.

Therefore,  $\dim \mathcal{L}_\alpha = 1$ .

Now, suppose  $\beta \neq \pm\alpha \in \Phi$ . Then,  $\exists r, q$  such that  $\beta - r\alpha, \beta - (r-1)\alpha, \dots, \beta + q\alpha$  are roots and outside these, i.e.  $\beta - (r+1)\alpha, \beta + (q+1)\alpha$  are not.

To see this, suppose  $K = \sum_{i \in \mathbb{Z}} \mathcal{L}_{\beta+i\alpha} \subseteq \mathcal{L}$  is a  $\mathcal{S}_\alpha$ -submodule. We know that  $\beta + i\alpha \neq 0$ .

Weights:

$$\beta(h_\alpha) + i\alpha(h_\alpha) = \beta(h_\alpha) + 2i$$

So, weights are either all even or all odd.

Therefore,  $K$  is irreducible.

Consider  $\gamma, \delta \in \mathcal{H}^*$ .

Define  $(\gamma, \delta) = \kappa(t_\gamma, t_\delta)$  on  $E_\mathbb{Q} = \text{span}_\mathbb{Q}(\Phi)$  then  $(\cdot, \cdot)$  extends to  $E = E_\mathbb{Q} \otimes_\mathbb{Q} \mathbb{R}$  is positive definite.

Then  $E$  is an Euclidean Space.

$(\Phi, E)$  is called a root system.

### 3 Thursday, 9/26/2024, Root Systems by Zoia

Let  $E$  be an euclidean space. Suppose  $(\alpha, \beta)$  is a symmetric bilinear form on  $E$ .  
 Reflection in  $E$  fixes some hyperplane  $H$ . If  $\alpha$  is perpendicular to  $H$  then the reflection sends  $\alpha$  to  $-\alpha$ .  
 Consider  $\alpha \in E$  and  $P_\alpha = \{\beta \in E \mid (\alpha, \beta) = 0\}$  the hyperplane perpendicular to  $\alpha$ .  
 Suppose  $\sigma_\alpha$  is the reflection w.r.t. this hyperplane. Then,

$$\text{proj}_\alpha(\beta) = \frac{(\beta, \alpha)}{(\alpha, \alpha)} \alpha$$

$$\sigma_\alpha(\beta) = \beta - 2 \text{proj}_\alpha(\beta) = \beta - 2 \frac{(\beta, \alpha)}{(\alpha, \alpha)} \alpha$$

Define:

$$\langle \beta, \alpha \rangle = 2 \frac{(\beta, \alpha)}{(\alpha, \alpha)}$$

Note that  $\langle \beta, \alpha \rangle$  is linear only in  $\beta$ . Then,

$$\sigma_\alpha(\beta) = \beta - \langle \beta, \alpha \rangle \alpha$$

**Lemma 3.1.** Let  $\Phi$  be a finite subset of  $E$  so that  $\Phi$  spans  $E$ . Suppose all reflections  $\sigma_\alpha (\alpha \in \Phi)$  leaves  $\Phi$  invariant. If  $\sigma \in \text{GL}(E)$  fixes hyperplane  $P$  of  $E$  and sends  $0 \neq \alpha \in \Phi$  to  $-\alpha$ , then  $\sigma = \sigma_\alpha$  and  $P = P_\alpha$ .

*Proof.* Suppose  $\tau = \sigma \sigma_\alpha = \sigma \sigma_\alpha^{-1}$ .

Then,  $\tau(\Phi) = \Phi$ ,  $\tau(\alpha) = \alpha$  and  $\tau$  acts as id on  $\mathbb{R} \cdot \alpha$  and  $E/R \cdot \alpha$  eigenvalues are 1.

So we have  $(T - 1)^L$  where  $L = \dim E$ .

$\beta, \tau(\beta), \dots, \tau^k(\beta) \exists k$  that fixes all  $\beta \in \Phi$

$\Phi$  spans  $E$ , so  $\tau^k = 1$ . So  $T^k - 1 = 0$ .

If  $m(T)$  is the minimal polynomial of  $\tau$ , then:

$$m(T) \mid T^k - 1$$

$$m(T) \mid (T - 1)^k$$

Therefore,  $m(T) = T - 1$ .

Therefore,  $\tau = \text{id}$ .

Thus  $\sigma \sigma_\alpha^{-1} = \text{id} \implies \sigma = \sigma_\alpha$  □

**Definition** (Root Systems). A finite subset  $\Phi$  of  $E$  is a root system in  $E$  if:

- 1R)  $\Phi$  spans  $E$ , does not contain 0.
- 2R) If  $\alpha \in \Phi$  then only multiples of  $\alpha$  in  $\Phi$  are  $\pm\alpha$ .
- 3R) If  $\alpha \in \Phi$ , then  $\sigma_\alpha$  leaves  $\Phi$  invariant.  $[\forall \beta \in \Phi, \sigma_\alpha(\beta) \in \Phi]$
- 4R) If  $\alpha, \beta \in \Phi$  then  $\langle \beta, \alpha \rangle \in \mathbb{Z}$ .  $\left[ \langle \beta, \alpha \rangle = \frac{2(\beta, \alpha)}{(\alpha, \alpha)} \right]$

**Definition** (Weyl Group). Let  $\Phi$  be a root system in  $E$ . Denote by  $\mathcal{W}$  the subgroup of  $\text{GL}(E)$  generated by  $\sigma_\alpha (\alpha \in \Phi)$ .

3R  $\implies \mathcal{W}$  is a symmetry group on  $\Phi$ .

**Lemma 3.2.** Let  $\Phi$  be a root system in  $E$  with Weyl group  $\mathcal{W}$ . If  $\sigma \in \text{GL}(E)$  leaves  $\Phi$  invariant, then  $\sigma \sigma_\alpha \sigma^{-1} = \sigma_{\sigma(\alpha)} \forall \alpha \in \Phi$  and  $\langle \beta, \alpha \rangle = \langle \sigma(\beta), \sigma(\alpha) \rangle \forall \alpha, \beta \in \Phi$ .

*Proof.*  $\sigma \sigma_\alpha \sigma^{-1}(\sigma(\beta)) = \sigma \sigma_\alpha(\beta) = \sigma(\beta - \langle \beta, \alpha \rangle \alpha) = \sigma(\beta) - \langle \beta, \alpha \rangle \sigma(\alpha)$ .

$\sigma(\beta)$  runs over  $\Phi$ .  $\sigma \sigma_\alpha \sigma^{-1}$  fixes  $\sigma(P_\alpha)$  pointwise and  $\sigma(\alpha) \rightarrow -\sigma(\alpha)$ .

Therefore,  $\sigma \sigma_\alpha \sigma^{-1} = \sigma_{\sigma(\alpha)}$  by the lemma.

$\sigma_{\sigma(\alpha)}(\sigma(\beta)) = \sigma(\beta) - \langle \sigma(\beta), \sigma(\alpha) \rangle \sigma(\alpha)$

Therefore, we must have  $\langle \beta, \alpha \rangle = \langle \sigma(\beta), \sigma(\alpha) \rangle$ . □

**Definition** (Isomorphisms). Suppose  $\Phi, \Phi'$  are root systems with Euclidean spaces  $E, E'$ .

$(\Phi, E) \cong (\Phi', E')$  if there exists map  $\varphi : E \rightarrow E'$  such that  $\varphi$  maps  $\Phi$  to  $\Phi'$  and  $\forall \alpha, \beta \in \Phi$  we have  $\langle \varphi(\beta), \varphi(\alpha) \rangle = \langle \beta, \alpha \rangle$ .

Note that:

$$\sigma_{\varphi(\alpha)}(\varphi(\beta)) = \varphi(\beta) - \underbrace{\langle \varphi(\beta), \varphi(\alpha) \rangle}_{=\langle \beta, \alpha \rangle} \varphi(\alpha) = \varphi(\beta - \langle \beta, \alpha \rangle \alpha) = \varphi(\sigma_\alpha(\beta))$$

Note that,  $\sigma \mapsto \varphi \sigma \varphi^{-1}$  is an isomorphism of Weyl groups.

Thus,  $\mathcal{W}$  is a subgroup of  $\text{Aut}(\Phi)$ .

Now we consider root systems of different dimensions. Suppose  $L = \dim E$ .

$L = 1$ : In this case, we have  $\alpha, \alpha \in \Phi$  only. This gives us  $A_1$

$$\mathcal{W}(A_1) = \mathbb{Z}_2$$

$L = 2$ :

$$\mathcal{W}(A_1 \times A_1) = \mathbb{Z}_2 \times \mathbb{Z}_2$$

$$\mathcal{W}(A_2) = S_3$$

$$\mathcal{W}(B_2) = D_4$$

$$\mathcal{W}(G_2) = D_6$$

These are the only possible cases for  $L = 2$ , since:

$$\langle \beta, \alpha \rangle = \frac{2\langle \beta, \alpha \rangle}{\langle \alpha, \alpha \rangle} = \frac{2\|\beta\|\|\alpha\| \cos \theta}{\|\alpha\|\|\alpha\|} = \frac{2\|\beta\|}{\|\alpha\|} \cos \theta \in \mathbb{Z}$$

Similarly,  $\frac{2\|\alpha\|}{\|\beta\|} \cos \theta \in \mathbb{Z}$ . Multiplying,  $4 \cos^2 \theta \in \mathbb{Z} \implies 4 \cos^2 \theta = 0, 1, 2, 3, 4$

Thus,  $\cos \theta = 0, \pm \frac{1}{2}, \pm \frac{\sqrt{3}}{2} \implies \theta = \frac{\pi}{2}, \frac{\pi}{3}, \frac{2\pi}{3}, \frac{\pi}{4}, \frac{3\pi}{4}, \frac{\pi}{6}, \frac{5\pi}{6}$ .

$\langle \alpha, \beta \rangle$	$\langle \beta, \alpha \rangle$	$\theta$	$\ \beta\ ^2 / \ \alpha\ ^2$
0	0	$\frac{\pi}{2}$	undefined
1	1	$\frac{\pi}{3}$	1
-1	-1	$\frac{2\pi}{3}$	1
1	2	$\frac{\pi}{4}$	2
-1	-2	$\frac{3\pi}{4}$	2
1	3	$\frac{\pi}{6}$	3
-1	-3	$\frac{5\pi}{6}$	3

Table 1: Angle Root System

**Lemma 3.3.** Suppose  $\alpha, \beta$  are non-proportional root.

If  $\langle \alpha, \beta \rangle > 0$  then  $\alpha - \beta$  is a root.

If  $\langle \alpha, \beta \rangle < 0$  then  $\alpha + \beta$  is a root.

*Proof.*  $\langle \alpha, \beta \rangle = 1 \implies \sigma_\beta(\alpha) = \alpha - 1\beta = \alpha - \beta \in \Phi$

If  $\langle \beta, \alpha \rangle = 1$  then  $\sigma_\alpha(\beta) = \beta - 1\alpha = \beta - \alpha \in \Phi$ .

$\sigma_{\beta-\alpha}(\beta - \alpha) = (\beta - \alpha) - \langle \beta - \alpha, \beta - \alpha \rangle(\beta - \alpha) = \alpha - \beta \in \Phi$

□
